

Session 3: Why We Think, Feel, & Behave the Way We Do

Key Points...

1. Human Psychology isn't rational.
 - From the inside it usually appears that our thinking, decisions and actions are "rational."
 - From the outside it usually appears that our thinking, decisions and actions are "irrational."
 - Humans do things for their reasons, not your reasons - and rarely are these reasons "rational."
2. Our Psychology is rooted in our past.
 - Great progress has been made "decoding" human psychology and behavior over the past decades.
 - The more we look for "evolutionary" drivers of our psychological mechanisms, the more we find them.
 - If you look behind most thoughts, feelings, and actions, you'll find survival, sex and status.
3. We humans have 3 brains in 1.
 - Our brain appears to be 3 brains in 1.
 - Reptile, Mammal, and Thinker.
 - The challenge? Our 3 brains aren't very well integrated - and the older brains seem to rule the newer.
4. We Humans are built and wired for a time that doesn't exist.
 - The modern environment has changed dramatically from our "original environment"
 - We have become "Homo Technoligus" living inside the self-built "Human Zoo."
 - But don't forget - our wiring hasn't changed! It's still built for the outside world.
5. We don't make decisions logically, and we make decisions unconsciously.
 - The process of making a decision appears to be "retinal" - so we assume that it is.
 - It now appears that most decisions aren't made consciously.
 - Instead, decisions are made on an unconscious level - then "rationalized" with the conscious mind.
6. We are completely overwhelmed by communications and choices.
 - We live in the world's first over-communicated society.
 - The level of choice we have is literally immobilizing us.
 - The average person has essentially no hope of silencing the increasing noise.
7. We are twice as motivated to avoid pain as we are to get pleasure.
 - Tests have shown that we humans will pay twice as much to avoid pain as get pleasure.
 - The "problem/fear/pain" aspect of what you sell is likely TWICE as important as the pleasure aspect.
8. When we have a need, our entire thinking & deciding process changes.
 - A person who is experiencing a need, a craving, a desire, a fear becomes a "different animal" - so to speak.

- When under the influence of a need, we become single-minded in our quest to satisfy it. Especially when it's about survival, sex, or status.
9. We humans are very bad at figuring out how much things are worth.
- Money, value, and prices are very confusing to humans.
 - We are constantly looking for cues, criteria, and comparisons to understand how much products and services are "worth."
10. All of this adds up to prospective customers who need CLARITY.
- You cannot hope to cut through this inner and outer noise without FOCUS.
 - You must know what you're offering, who it's for, and what the benefit is to them - then present it to the IRRATIONAL human mind.
 - If you don't, you might as well not even start.
